Subject Description Form

Subject Code	SD5412
Subject Title	Advanced Service Design Methods and Tools
Credit Value	3
Level	5
Pre-requisite/ Co-requisite/ Exclusion	Nil
Objectives	This subject introduces in-depth knowledge of different research methods to understand the systemic context, different stakeholders and users, and their needs using both qualitative and quantitative data. This subject examines new and emerging methods from research undertaken within service design, as well as the appropriation of methods from other disciplines. Students process the data gathered through research to develop key insights and establish design objectives for their design proposition. Criteria are developed by students to assess the different concepts arising from their ideation process. Research exploration, through human-centred dimensions of design approaches and process, give students an understanding of the potential opportunities from economic, technological, and socio-cultural challenges.
Intended Learning Outcomes	Upon completion of the subject, students will be able to: <u>Professional skills</u> a. Understand emerging techniques and apply different research methodologies b. Apply alternative design approaches, processes, and methods to the design of services c. Understand a data-driven approach to design, combining quantitative and qualitative data input into the design process d. Select appropriate methods and techniques to meet specific scenario objectives and goals <u>Transferable skills</u> e. Apply learnt concepts and methods for interdisciplinary and team-based design activities f. Demonstrate critical analysis and apply these methods at a high level
Subject Synopsis/ Indicative Syllabus	Students will be introduced to: • The various principles and fundamental research methods (theory, models, planning, and practice) of service design • Human-centred design, observation techniques and practices (e.g. inclusive design, ethnographic design) • Data-driven service innovation (e.g. explorative, validative and generative data-driven service innovation). • Persona development and customer journey maps and experience mapping • Analysis and insight development, problem framing, identifying opportunity areas, and design specifications • The application of methods and processes of integrative design thinking in interdisciplinary team-based settings or contexts

Teaching/Learning Methodology

Activity	Purpose
Lecture	To introduce students to concepts and methodologies for designing services, the principles of service design, and related theories and concepts.
Workshop	Workshops consist of hands-on tasks which allow students to experience specific aspects of knowledge, concepts and theories deepening their understanding of lecture material.
Project	Group work emphasises collaborative learning, problem-solving and critical evaluation, and is valuable preparation for the workplace. Working together on a project will make use of complementary skills, deepen students' understanding through interaction and discussion, and deal with a range of perspectives thereby enhancing critical thinking skills. Students will need to apply taught theories, concepts, methods, and tools introduced to the practical aspects of the project in the simulation of a real-world exercise.

Assessment Methods in Alignment with Intended Learning Outcomes

Specific assessment methods/tasks	% weighting	Intended subject learning outcomes to be assessed					
		a	b	c	d	e	f
Class Participation	25%	✓	✓	✓	✓		
Group Project	60%		✓	✓	✓	✓	✓
Assignments & Case Study	15%	✓		✓		✓	✓
Total	**100%**						

Explanation of the appropriateness of the assessment methods in assessing the intended learning outcomes:

Class Participation	To encourage students to engage with course learning and develop their ability to communicate and discuss ideas. Participation in presentations, critiques, and seminars requires students to actively engage in-class discussion and exchange, reflect upon their project progress, and review designs critically. These improve levels of participation in the class and provide immediate feedback on the learning.
Group Project	Group work emphasises collaborative learning, problem-solving and critical evaluation, and is valuable preparation for the workplace. Working together on a project will use complementary skills, deepen students' understanding through interaction and discussion, and deal with a range of perspectives thereby enhancing critical thinking skills. Students will need to apply taught theories, concepts, methods, and tools introduced to the practical aspects of the project in the simulation of a real-world exercise.

	Assignments and Case Study Analysis	To evaluate the students' ability to acquire new skills essential to professional service design and methods in case analysis format. Case studies apply theoretical ideas to practical contexts. They enable students to see the relevance of academic ideas, prompting them to use ideas creatively and to think laterally - important preparation for the workplace.
Student Study Effort Expected	Class contact:	
	▪ Lectures	9 Hrs.
	▪ In-class exercises	10 Hrs.
	▪ Tutorial, workshop and presentation: group and/or individual	20 Hrs.
	Other student study effort:	
	▪ Self-study	35 Hrs.
	▪ Project / group work	42 Hrs.
	Total student study effort	**116 Hrs.**
